

Cranford's Granulated Compost

Directions & Application Rates

Directions: Apply recommended amount around plants and water to begin dissolving granulars.

Hints: Granulars are designed to dissolve quickly in water. To speed up dissolving on top of soil:

1. Water a little to begin “softening”
2. Wait a few minutes and water again to break apart
3. Wait again and finish watering to dissolve completely

This process is the preferred method to dissolve the granulars on top of soil. The granulars dissolved will look like mud, but the microbes and nutrients will be working themselves into the soil to begin work. The next few waters will completely dissolve the mud into the soil.

For quicker results, mix one to two ounces (or more) of granulars in one gallon of water. Wait 60 seconds and agitate to mix. Apply directly to soil or use as a foliar feed. One gallon will cover 5 plants. Once applied, add more water to plants if needed.

Application Rates:

Apply monthly during growing season or as often as desired.

<u>Application</u>	<u>Amount of Compost</u>
Established Plants	2 capfuls/plant
Indoor Plants	1 capful/plant
Turf	1 lb/100 ft ²
Tea	1 – 2 oz/gallon (5 – 10 capfuls/gallon)
Greenhouse	1 capful and tea
New Plantings	5 capfuls (1 oz) mixed into soil
Row Crops	32 lbs/acre

Use to promote soil activity & supply essential nutrients to the root zone of plants
